

Cautions for using the IR LED

When using the IR LED to view images, if the tilt angle is adjusted towards a wall, reflections from the wall may cause all or a part of the image to appear washed out. Adjust the tilt so that there are no reflections from walls in images.

Cautions for mounting the enclosure

Mount the enclosure to the camera body at a straight angle.

If the enclosure is not mounted to the camera body at a straight angle, the inside of the dome cover may make contact with the camera portion, which may result in the configured viewing angle moving out of alignment.

The light-blocking rubber ring may be stretched depending on the tilt angle. This will not damage the light-blocking rubber ring.
